

AGILE PROJECT MANAGEMENT

Agile project management is used when complex initiatives need to be implemented and/or an environment of constant change is present.

Vision & Business Case

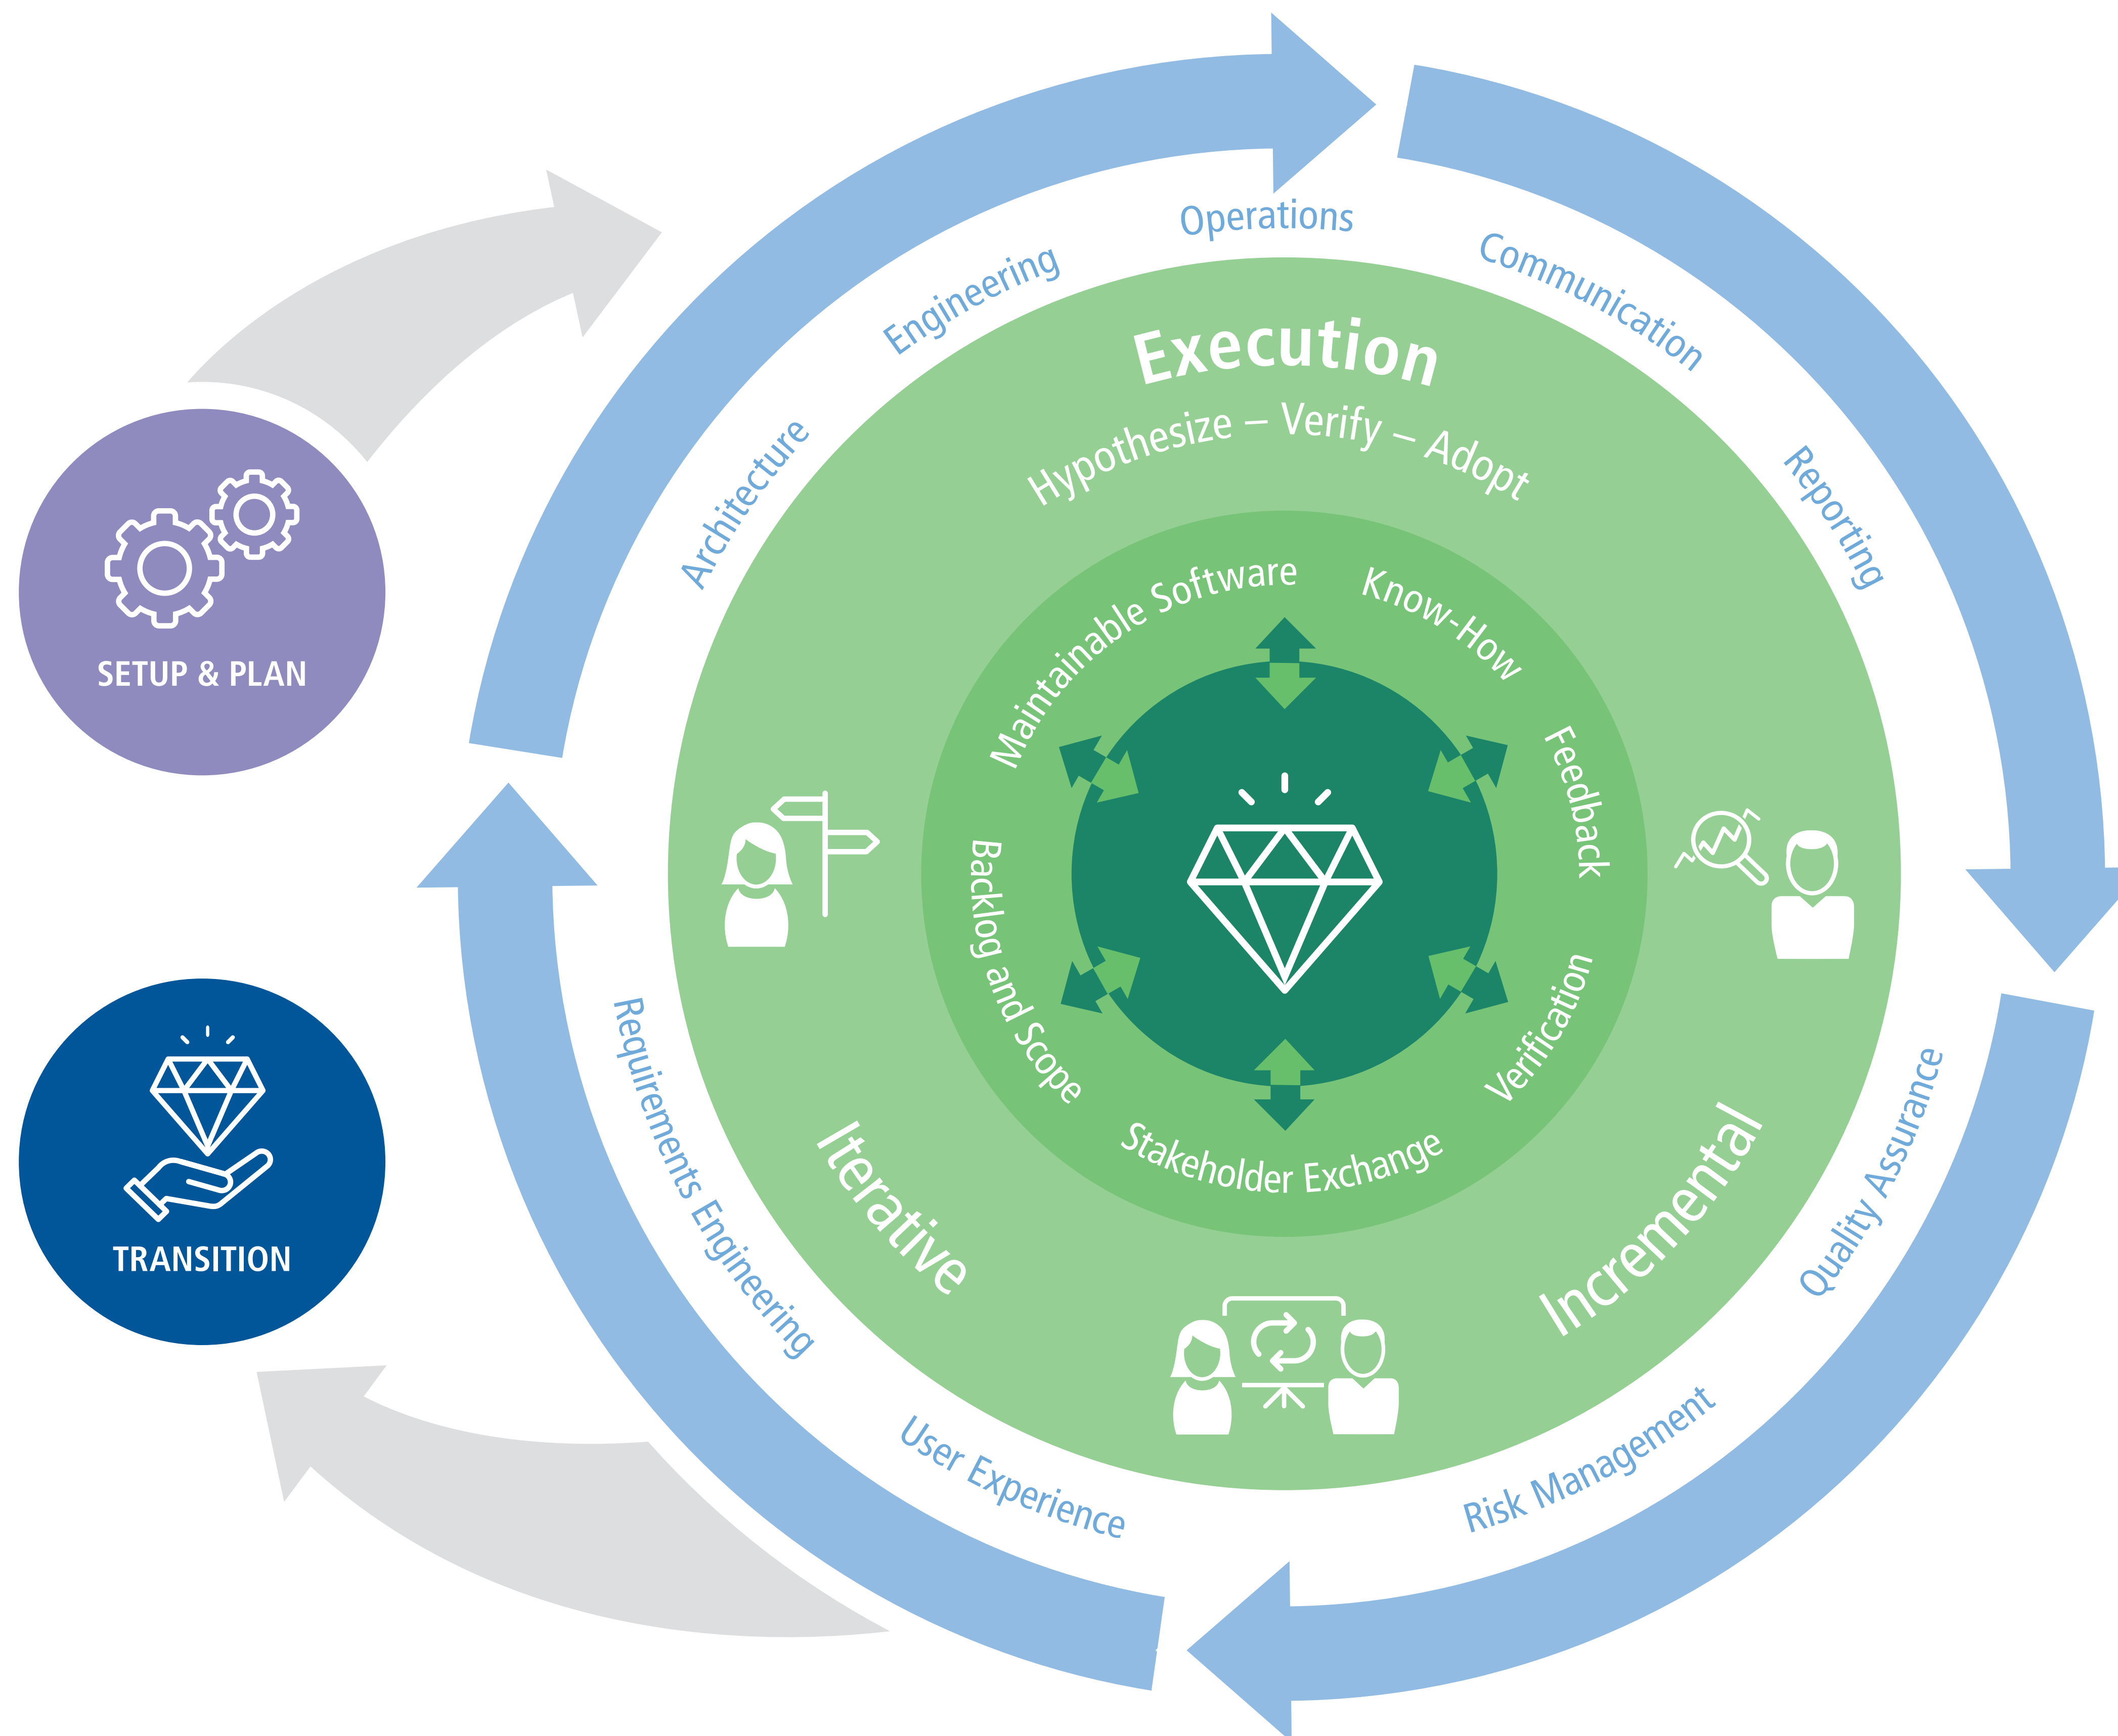

Visionary outlooks
With the vision, the customer describes the essential characteristics of his product, which are to be realised in cooperation with bbv.

Economic examination
The business case examines the new product under financial and strategic aspects in the customer's environment. This applies in particular to profitability in various scenarios.

Setup & Plan

Initiating the project
Roles and competencies are defined and stakeholders and communication strategies are recorded. In addition, the organization and project infrastructure are set up and risk management is initiated.

Initial planning
The initial feature list will be further detailed into a prioritized product backlog and estimated. Also the planning of milestones and project structure under consideration of external dependencies is a factor influencing the success of a project.

Execution

Generating added value
With the iterative and incremental planning and implementation of requirements in the backlog, the product is improved continuously. A regular exchange with stakeholders enables verification and adaptation.

Collaboration is key
Self-organized, respectful and interdisciplinary teams work hand in hand to generate sustainable solutions. Continuous process improvements enable ever increasing efficiency and effectiveness.

Value

High-quality product increments
Regular presentation, transfer and acceptance of maintainable product increments and documentation enables a smooth transition to the new product. Fast feedback supports learning and ensures mutual satisfaction.

Fast Feedback
Fast Feedback within the team but also from stakeholders support learning an ensures mutual satisfaction.

Transition

Delivery to customer
An inspection ensures that the customer can take over, use and further develop the product. Also the fulfillment of the contract components is part of it and whether a further support of the customer by bbv would be reasonable.

Review of the cooperation
A final evaluation regarding the vision and satisfaction of the customer together with a final Lessons Learned should provide mutual knowledge to successfully form future projects.
